

# Programming in Java

## Objectives

- ◆ In this session, you will learn to:
  - ◆ Design classes
  - ◆ Identify relationships between classes
  - ◆ Define information hiding
  - ◆ Define encapsulation
  - ◆ Explore the concept of abstraction
  - ◆ Explore the concept of inheritance

# Programming in Java

## Designing Classes

# Programming in Java

## Designing Classes (Contd.)

- ◆ Perform the following steps to design classes:
  1. Identify the set of classes that will constitute the software system.
  2. Determine the responsibilities of each class.
  3. Determine the interactions between classes.
  4. Identify the attributes and behavior of each class.
  5. Identify the scope of the class members.

# Programming in Java

## Identifying Relationships Between Classes

# Programming in Java

## Identifying Relationships Between Classes (Contd.)

Let us understand how you  
can identify the relationships  
between classes.

# Programming in Java

## Identifying Relationships Between Classes (Contd.)

- ◆ Object-Oriented Programming (OOP):
  - ◆ Classes and objects are related to each other
  - ◆ Object's behavior is shown by the action it performs:
    - ◆ Behavior finds out the relationship between the objects and classes

# Programming in Java

## Kinds of Relationships

# Programming in Java

## Kinds of Relationships (Contd.)

- ◆ Relationships between the objects of different classes:
  - ◆ Composition
  - ◆ Generalization
  - ◆ Utilization
  - ◆ Instantiation

# Programming in Java

## Kinds of Relationships (Contd.)

- ◆ Composition relationship:
  - ◆ Object includes another object as its part.
  - ◆ Contains objects that have a “has-a” relationship.
  - ◆ The following figure shows the composition relationship between a car and an engine.

# Programming in Java

## Kinds of Relationships (Contd.)

- ◆ Generalization relationship:
  - ◆ Classes inherit commonly used state and behavior from other classes
  - ◆ Each class allowed to inherit from one or multiple classes
  - ◆ Structure and behavior that is common to different classes are combined to form a super class
  - ◆ Subclass is a specialized form of the super class
  - ◆ Super class is a generalized (common) class
  - ◆ Generalization helps to create programs that can be customized in accordance with new requirements

# Programming in Java

## Kinds of Relationships (Contd.)

- ◆ Utilization relationship:
  - ◆ Class uses another class.
  - ◆ The following figure shows the utilization relationship between a car and a driver; and a bus and a driver.

# Programming in Java

## Kinds of Relationships (Contd.)

- ◆ Instantiation relationship:
  - ◆ Relationship between a class and an instance of that class

# Programming in Java

## Exploring the Concept of Inheritance

# Programming in Java

## Exploring the Concept of Inheritance (Contd.)

Let us understand how you  
can use inheritance in  
classes.

# Programming in Java

## Exploring the Concept of Inheritance (Contd.)

### ◆ Inheritance:

- ◆ Subclass objects get the copy of the data members and member functions of the super class
- ◆ Subclass:
  - ◆ Class inherits attributes from another class
- ◆ Super class:
  - ◆ Class from which attributes are derived

# Programming in Java

## Types of Inheritance

# Programming in Java

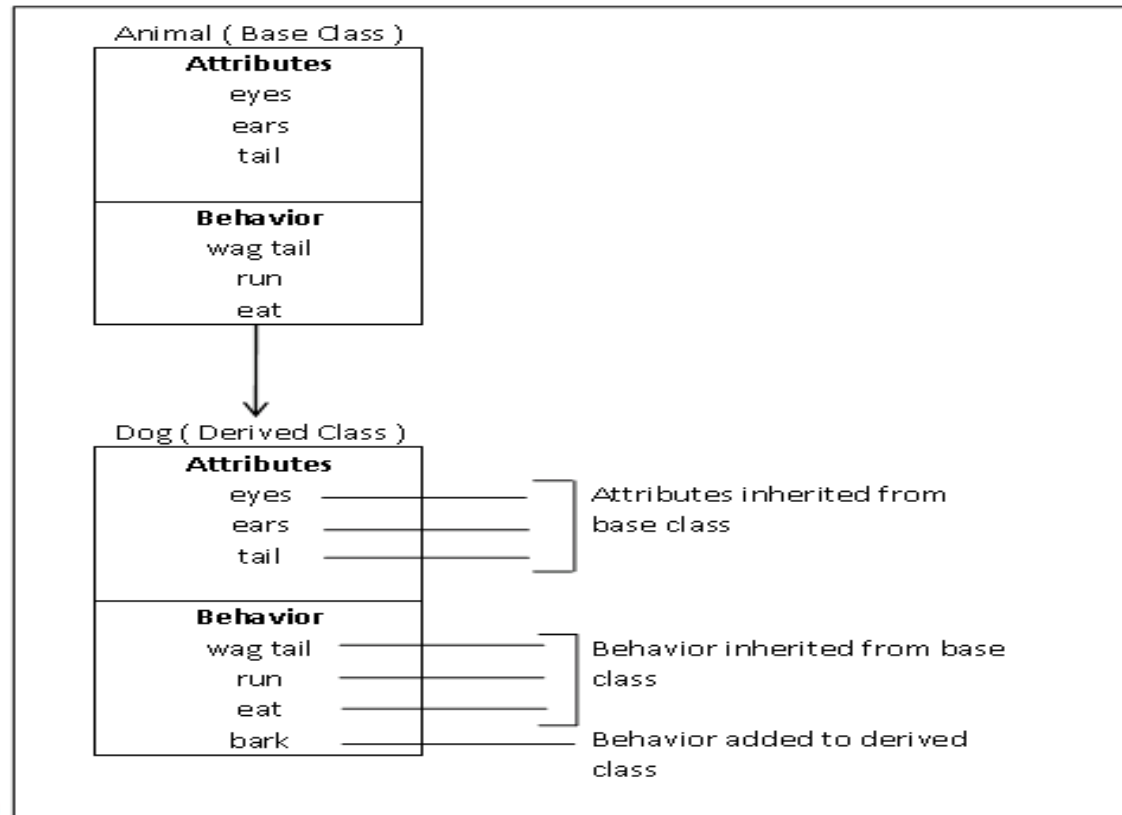

## Types of Inheritance (Contd.)

- ◆ Types of inheritance:
  - ◆ Single inheritance
  - ◆ Multiple inheritance
  - ◆ Multilevel inheritance

# Programming in Java

## Types of Inheritance (Contd.)

- ◆ Single inheritance:
  - ◆ One child class has one parent class.
  - ◆ The following figure depicts an example of single inheritance.

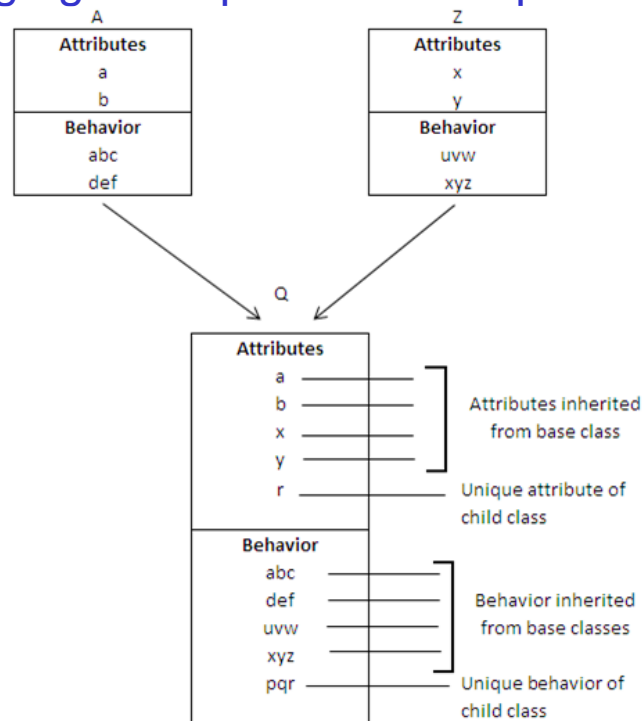

# Programming in Java

## Types of Inheritance (Contd.)

### ◆ Multiple inheritance:

- ◆ One child class has more than one parent class.
- ◆ The following figure depicts an example of multiple inheritance.

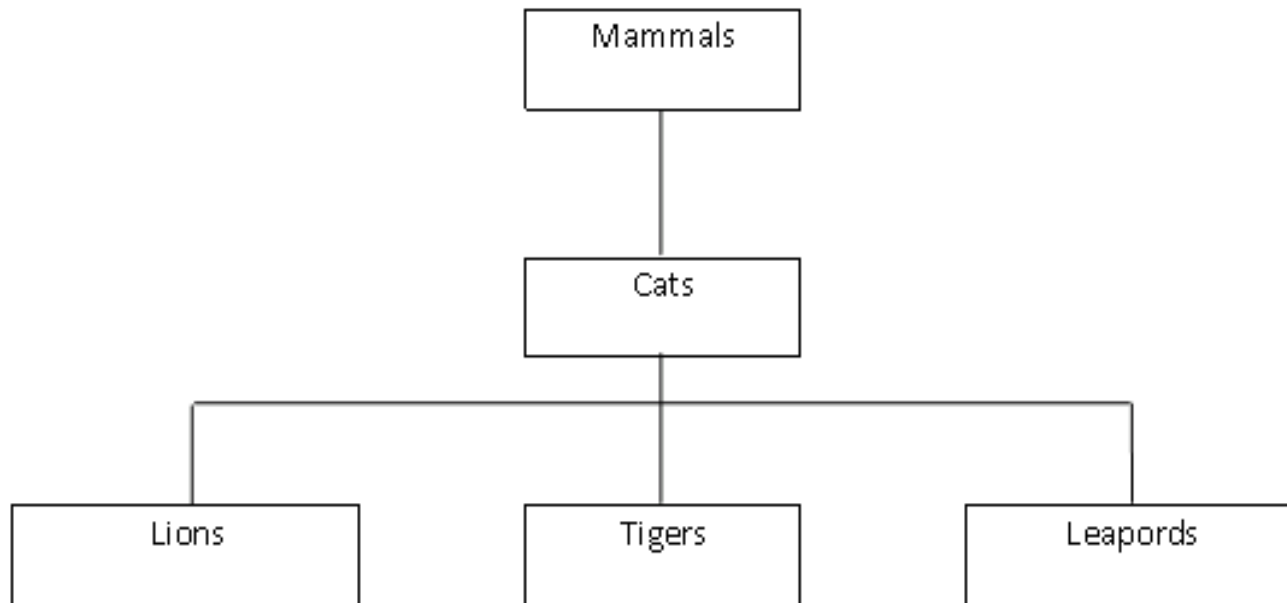

# Programming in Java

## Types of Inheritance (Contd.)

### ◆ Multilevel inheritance:

- ◆ Subclass is derived from a derived class.
- ◆ The following figure depicts an example of multilevel inheritance.

# Programming in Java

## Exploring the Concept of Polymorphism

# Programming in Java

## Exploring the Concept of Polymorphism (Contd.)

Greek Words and Their Meanings

Poly = Many  
Morphos= Forms

Polymorphism = Many Forms

# Programming in Java

## Exploring the Concept of Polymorphism (Contd.)

- ◆ Polymorphism:
  - ◆ Ability to allow a function to exist in different forms

Let us understand  
polymorphism with the  
help of examples.

# Programming in Java

## Exploring the Concept of Polymorphism (Contd.)

Different moods of a person depending upon the situation he is in depict polymorphism

# Programming in Java

## Exploring the Concept of Polymorphism (Contd.)

Role of a lady being a mother and an instructor at the same time depicts polymorphism

# Programming in Java

## Summary

- ◆ In this session, you learned that:
  - ◆ In Object-oriented programming, classes and objects are related to each other.
  - ◆ Relationships that exist between the objects of different classes are:
    - ◆ Composition
    - ◆ Generalization
    - ◆ Utilization
    - ◆ Instantiation
  - ◆ Types of inheritance are:
    - ◆ Single inheritance
    - ◆ Multiple inheritance
    - ◆ Multilevel inheritance
